PLASTIC WEB ROLLER COATER

This Union Roller Coater is specifically designed to apply a silicone, anti-fog, or anti-static coating to one or both sides of plastic packaging materials in a thermoforming process. This coater includes the Unwind stand which holds and feeds out the plastic web controlled by a variable speed motor that changes speed from the direction of a loop control dancer arm.

The coater is a double coater that has the ability to apply a streak free coating that is consistent and controllable. The coater is also powered by a variable speed motor that changes speed with the cycle of the forming equipment. Should the web stop, the coater and the unwind would also stop.

Other features of the coater include coating pump system, single hand wheel controls, indicator read-outs on the adjustments, air cylinder opening and safety interlocks on guards.

Union Tool also manufactures this type machine to work in an extrusion process applying the various type coatings.
